

## # Database

↳ is used to persist the data  
store permanently

### Types of Database

Relational

↓  
Tables } → rows + columns

Non-relational

↓  
Documents } mongoDB

↳ MySQL  
↳ PostgreSQL  
↳ MSSQL

## #

JDBC → Java Database Connectivity

- establishes connection
- String s = " " →
- create Statement
- execute

## #

\_\_\_\_\_ / classes that hold

#

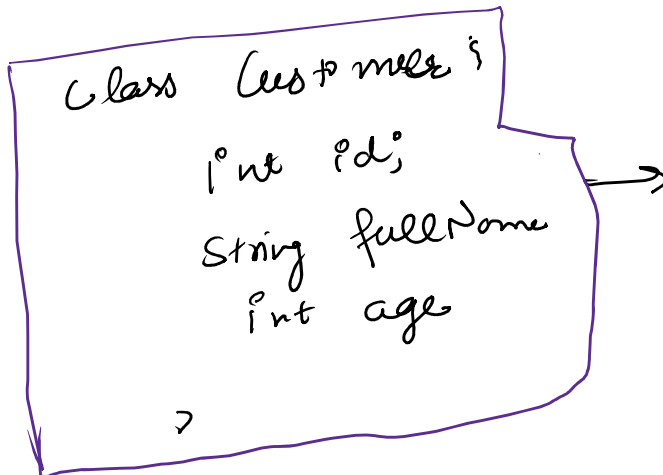

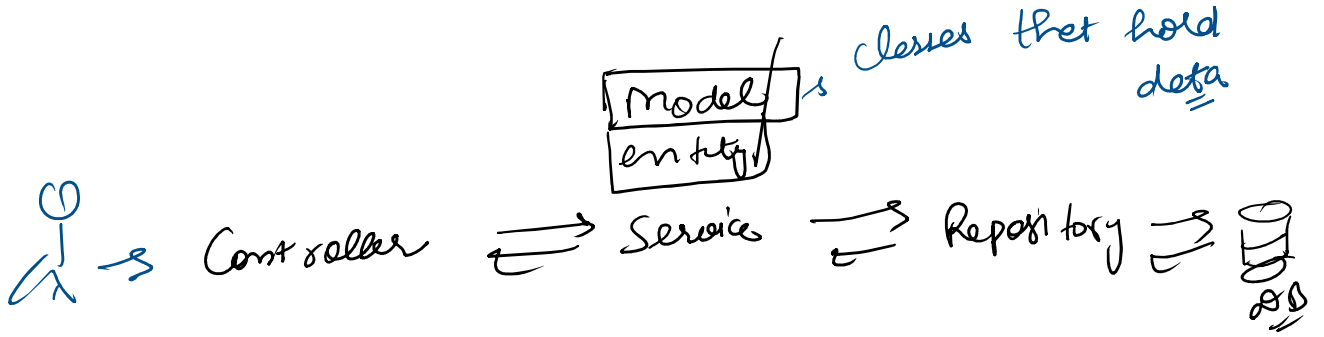

Table representation of the Customer class:

id	full-name	age
1	ABC	30
.	.	.
.	.	.
.	.	.

Annotations: "id" is circled and labeled "int". "full-name" is circled and labeled "varchar". "age" is circled and labeled "int".

class name → table name  
 attributes → columns

+  
Handle DB operation

DB operations are handled by someone else

ORM → [Object Relational Mapper]  
Java      Tables

↓  
Hibernate → ORM framework

iBatis, TopLink

A library / framework which exposes a set of Java functions which can be used to perform DB operations.

microsystem

Java microsystems

JPA → Java Persistence API } ORM framework  
↓  
interface } general implementation  
a specification for an ORM

framework

→ API  
Hibernate ✓  
JPA ✓

JPA ✓  
Hibernate ✗

# Enum  
↓  
data type which is used when the no. of  
input values is limited and fixed.

days of week

② Not Null → works at the application/ Java level

③ `Column(nullable = false)` → works at DB level  
↓  
adds constraint to the  
DB column.
